

APPENDIX A

Please amend the Abstract as follows:

[The present invention provides an initial graphic symbol and color scheme to represent a particular application. As a user traverses related objects belonging to the same family, the initial graphic symbol and color scheme is persistent throughout each of the related objects.]

Described is a system and method for visually delineating a relationship between diverse, but related graphical objects in a graphical user interface. An icon that has a specified color scheme is associated with the diverse, but related graphical objects. When one of the related graphical objects is displayed, the icon is displayed within the displayed graphical object. The persistence of the icon with the specified color scheme in the displayed graphical objects them to to be recognized as related.
